## Watering System – Nozzle & Hose Installation

We ship the unit with the nozzles, hoses, and sway bar not attached to ensure that the nozzles, clamps, and hoses arrive safely to your location.

### Nozzle Installation:

Take the nozzles and clamps from the water tanks at the top of the **system. Make sure the nozzles are pointing towards the arena tool's** pegged finishing roller. Use the image below and the arrows within the image as a guide to walk you through the installation of the clamps and the nozzles to the sway bar. Make sure to fasten the clamps securely to each hook up both to the nozzle and sway bar and to the nozzle and hose to ensure that no water leaks from the unit.

If you have any questions **please don't hesitate to call a Ground Hog** Expert at 866-689-8904.

## Hose Installation:

Connect the two main hoses from the two water pumps to the where the big white arrows are located on the image below. These main nozzle to hose hook ups are the last nozzles located within the main frame of the watering system.

Then use additional hoses to connect the two remaining nozzles on each side of the unit with water from main hook ups. With one nozzle on each side of each main hose hook up. Use the image below and use the arrows within the image as a guide to walk you through the installation of the hoses and nozzles.

If done correctly there should be one additional hose connecting the water to the nozzles on each side of the two main hook up arrows. Make sure to fasten the clamps securely to each hook up both main and secondary to ensure that no water leaks from the unit.

If you have any questions **please don't hesitate to call a Ground Hog Expert at 866-689-8904.**
